DETAILED ACTION

Information Disclosure Statement

1. The information disclosure statement (IDS) submitted on 01-24-2005, the information disclosure statement is being considered by the examiner.

Allowable Subject Matter

2. Claims 1-24 are allowed.

Reasons for allowance

3. The following is an examiner's statement of reasons for allowance:

Regarding independent claims 1, 7, 11, 17 and 23, the reference of Wentink (U.S. Pub. No. 20030181212) teaches the context of IEEE 802.11 local area networks, the illustrative embodiment is advantageous because it does not require a change to 802.11's coordination function (e.g., distributed coordination function, enhanced distributed coordination function, point coordination function, etc.). Furthermore, stations in accordance with the illustrative embodiment continue to gain access to the shared-communications channel on a statistically-equal basis, although higher-class-of-service applications are able to transmit more frames at each transmission opportunity than are lower-class-of service applications (see page 1, section [0010 and 0016]). And reference of Benveniste (U.S. Pub. No. 20050149136) teaches the access point 201 determines, based on existing schedules (e.g., wake-up schedules for other power-saving stations, polling schedules, etc.), whether temporal period .pi. can'be accommodated (i.e., whether the shared-communications channel can handle the additional "load" of the desired

wake-up schedule without the rate of collisions exceeding a particular threshold T.) (see page 3, section [0050]).

However, the references of Wentink, Benveniste and the prior art of record fail to disclose, the method comprising: asserting a polite request signal that requests that a first transceiver relinquish transmitting via a shared-communications channel, wherein said first transceiver communicates in accordance with a first communications protocol; indicating via said shared-communications channel that a second transceiver hold subsequent transmissions to said first transceiver; asserting a first signal that indicates that said first transceiver has relinquished transmitting via said shared-communications channel; and transmitting at least one frame from a third transceiver via said shared-communications channel after said asserting of said first signal, wherein said third transceiver communicates in accordance with a second communications protocol as cited in claims 1, 11 and 17. And also fail to disclose the A method comprising: notifying a first transceiver to exit a power save state, wherein said first transceiver communicates in accordance with a first communications protocol via a shared-communications channel; asserting a transmitting indication signal that indicates that a second transceiver is transmitting via said shared communications channel in accordance with a second communications protocol; and transmitting at least one frame from said second transceiver after said notifying and before said first transceiver has recovered from said power save state as cited in claim 7 and 23.
